The views and interpretations in this paper are those of the author(s). They are not attributable to the International Centre for Integrated Mountain Development (ICIMOD) and do not imply the expression of any opinion concerning the legal status of any country, territory, city or area of its authorities, or concerning the delimitation of its frontiers or boundaries.

Because of rapidly growing populations and a dwindling resource base in mountain areas, sustainable development involves greater and conflicting demands on available resources. Decision-makers need to monitor and analyse the changing resource bases of specific ecosystems in order to make informed choices. Modern Information Technologies, such as GIS, RS, and GPS, can facilitate this. These technologies allow planners to process large volumes of data from multiple sources. These data can be integrated to produce maps, monitor changes, and model the impact of management decisions. GIS and related technologies improve data handling capabilities and encourage different stakeholders to re-examine their roles with respect to the supply and availability of data both in terms of biophysical and socioeconomic aspects. The demand for accurate and homogeneous spatial data has clearly been established by research and development communities. There is hardly anywhere in the HKH area that is as much in need of a reliable and dynamic database as the Kathmandu Valley in Nepal. Rapid urban expansion is taking over fertile agricultural land and scenic spots. The increasing population needs basic services such as water, electricity, telephones, and other essential infrastructure.

With support from the United Nations Environment Programme (UNEP/EAP-AP), ICIMOD facilitated the establishment of an Environment, Information, and Assessment (EIA) Unit at the Ministry of Population and Environment, HMG, Nepal. One of the components of the EIA project was to carry out a Kathmandu Valley GIS study with the aim of preparing a core GIS Database. This study was taken up as a pilot study to raise awareness about the potential of the technology and its usefulness in planning and decision-making.

The study established a core Kathmandu Valley GIS database based on available maps and remote-sensing images. It is hoped that the database will be used as a starting point for research and development activities in planning and management of the Valley. This document serves to raise awareness about the existence of digital data, and it will hopefully serve to avoid duplication of efforts in future. To encourage and improve information exchange the database and the complete publication are available on an interactive CD-ROM.

This study was undertaken by Mr. Basanta Shrestha, Systems' Specialist, and Mr. Sushil Pradhan, GIS Analyst. Digitisation of the topographic database was undertaken by Mr. Anirudra Man Shrestha, senior cartographer at MENRIS. Other MENRIS staff who assisted in the study are 'Mr. Pradeep Mool, Mr. Birendra Bajracharya, Mr. Sushil Pandey, Mr. Govinda Joshi, Mr. Saisab Pradhan, Ms. Mona Thapa, and Ms. Monica Moktan. EIA project staff at MoPE, Mr. Bhusan Pradhan, Mr. Manohar Bhattarai, Ms. Sunjita Pradhan, and Mr. Madhav Adhikari, have assisted in the compilation of data sets. On behalf of ICIMOD, we would like to thank them all for their contributions. We would also like to thank Mr. Surendra Shrestha, Regional Coordinator of the United Nations Environment Programme, Environment Assessment Programme – Asia Pacific (UNEP- EAP/AP) for his inputs and for facilitating the financial support of UNEP. Lastly, we would like to express our sincere thanks and appreciation to the Ministry for all the support provided for this study.

ABSTRACT

Recently, there has been a continuing growth in the use of GIS and related technologies by many organizations engaged in planning and management of the Kathmandu Valley. As a result, the demand for accurate standardised spatial data of the Valley for government use as well as for use by research and development organizations has grown.

This study is about attempts to build a comprehensive GIS Database of the Kathmandu Valley as a means of bridging important data gaps. The study employs a fresh approach using the maps available and integrating with satellite images. The maps presented in this publication visualise the environment and raise awareness about digital databases. It is hoped that the application presented in this publication will increase awareness about the usefulness of digital databases and demonstrate what can be achieved with GIS and related technologies. It is also hoped that this database will improve information on the Kathmandu Valley and assist different stakeholders engaged in planning and management of services.

Furthermore, the study advocates a building block approach to development, management, and revision of databases in a complementary way to avoid duplication of efforts in costly production of digital data. The study aims to sensitise senior executives and decision-makers about the need for a sound policy on database sharing, development, and standards. Such a policy, at the national level, known as a National Spatial Database Infrastructure (NSDI), should evolve in order for everyone to benefit from the prevailing GIS technology. In using GIS and related technologies, the study facilitated the establishment of a Spatial Data Infrastructure of the Kathmandu Valley.

ACRONYMS

ADEOS	Advanced Earth Observation Satellite
AML	Arc Macro Language
AVNIR	Advanced Visible and Near – Infrared Radiometer
CBS	Central Bureau of Statistics
CD-ROM	Compact Disc – Read Only Memory
DBMS	Database Management System
DEM	Digital Elevation Model
DHUD	Department of Housing and Urban Development
DOS	Department of Survey
DTM	Digital Terrain Model
DWSS	Department of Water Supply and Sanitation
EAP-AP	Environment Assessment Programme – Asia Pacific
EIA	Environment Information and Assessment
ESRI	Environmental Systems Research Institute
ERDAS	<i>Trade mark of ERDAS Inc., developer of ERDAS Imagine software</i>
FINNMAP	Finnish Map
FCC	False Colour Composite
GIS	Geographic Information Systems
GPS	Global Positioning System
GCP	Ground Control Points
HKH	Hindu-Kush Himalayas
HMG/N	His Majesty's Government of Nepal
HRV	High Resolution Visibility
IBM	International Business Machine
IRS	Indian Remote Sensing Satellite
KMC	Kathmandu Metropolitan Office
KUDP	Kathmandu Urban Development Project
ICIMOD	International Centre for Integrated Mountain Development
IUCN	International Union for Conservation of Nature
LANDSAT	Land Observation Satellite
LRMP	Land Resource Mapping Project
MENRIS	Mountain Environment and Natural Resources' Information Service
MoPE	Ministry of Population and Environment
MSS	Multi-spectral Scanning
NEPAP	Nepal Environmental Policy and Action Plan
NSDI	National Spatial Data Infrastructure
NTC	Nepal Telecommunications Corporation
PAN	Panchromatic

RS	Remote Sensing
RDBMS	Relational Database Management Systems
SPIN	Space Information
SPOT	Satellite Probatoire d'Observation de la Terre
TM	Thematic Mapper
TCC	True Colour Composite
VDC	Village Development Committee
UNEP	United Nations Environment Program
UTM	Universal Transverse Mercator System
XS	Multi-spectral

LIST OF MAPS

- Map 1 Index Contours at 20 Metres Intervals
- Map 2 Elevation Zones
